Hazard Identification

What exactly is the hazard with AMR?

- The drug, i. e. residues of the drug?
- The bacterial species?
- The resistance determinant, i.e. the resistance gene?
- The DNA carrying the resistance gene (Plasmid, Integron etc.)?

- 1. Hazard identification
- 2. Hazard characterisation
- 3. Exposure assessment
- 4. Risk characterisation

Risk Assessment

- 1. Hazard identification
- 2. Hazard characterisation
- 3. Exposure assessment
- 4. Risk characterisation

Aim: to describe the foodborne AMR hazard of concern Specific strains or genotypes of foodborne microorganisms that may pose risks by a particular combination of

- food commodity,
- AMR microorganism and / or determinants and
- antimicrobial agents which are affected by resistance.

Risk Assessment

- 1. Hazard identification
- 2. Hazard characterisation
- 3. Exposure assessment
- 4. Risk characterisation

Information on the biology of AMR microorganisms / determinants within different environments / niches e.g.

- interactions with other bacteria
 - in animal feeds,
 - aquaculture or
 - the gut environment
 - in food matrices

Information on susceptible strains of the same organisms or related AMR microorganisms and / or determinants are useful.

Hazard Identification (Annex 2)

CAC/GL 77-2011	Page 1 of 29
CUIDELINES FOR RISK ANALYSIS OF FOODBORNE ANTIN	IICROBIAL RESISTANCE
CAC/GL 77- 2011	

1.1 Identification of hazard of concern:

foodborne AMR microorganisms and / or determinants

1.2 Microorganisms and resistance related information

- Potential human pathogens (phenotypic and genotypic characterization) that are likely to acquire resistance in non-human hosts
- Commensals with AMR determinants (phenotypic and genotypic characterization) and the ability to transfer them to human pathogens
- Mechanisms of AMR, location of AMR determinants, frequency of transfer and prevalence among human and non-human microflora
- Co- and cross-resistance and importance of other antimicrobial agents whose efficacy is likely to be compromised
- Pathogenicity, virulence and their linkage to resistance

Hazard Identification (Annex 2)

CAC/GL 77-2011	Page 1 of 29
CUIDELINES FOR DISK ANALVSIS OF FOODRODNE AND	TIMODODIAL DESISTANCE
GUIDELINES FOR RISK ANALYSIS OF FOODBORNE AN	I MICROBIAL RESISTANCE
CAC/GL 77- 2011	

1.3 The **antimicrobial agent** and its properties

- Description of the antimicrobial agent name, formulation, etc.
- Class of antimicrobial agent
- Mode of action and spectrum of activity
- Pharmacokinetics of the antimicrobial agent
- Existing or potential human and non-human uses of the antimicrobial agents and related drugs

Hazard characterisation

Which adverse health effects could be relevant?

Risk Assessment

- Hazard identification 1.
- 2. Hazard characterisation
- 3. **Exposure** assessment
- **Risk characterisation** 4.

and loss of treatment options

Adverse health effects related resistance 9

→ Estimation of diseases and infections (= adverse health effects) related to AMRM

Hazard Characterisation (Annex 2)

GUIDELINES FOR RISK ANALYSIS OF FOODBORNE ANTIMICROBIAL RESISTANCE CAC/GL 77- 2011

3.1 Human host and adverse health effects

- Host factors and susceptible population
- Nature of the infection, disease
- Diagnostic aspects
- Epidemiological pattern (outbreak or sporadic)
- Antimicrobial therapy and hospitalization
- Importance of the antimicrobial agents
- Increased frequency of infections and treatment failures
- Increased severity of infections (duration[↑], frequency[↑], hospitalization[↑], mortality[↑])
- Persistence of hazards in humans
- 3.2 Food matrix related factors influencing survival of microorganism in the gut

3.3 **Dose-response relationship** between exposure and probability of outcome

Page 1 of 29

Hazard Characterization

Risk Assessment

- 1. Hazard identification
- 2. Hazard characterisation
- 3. Exposure assessment
- 4. Risk characterisation

Various disease outcomes associated with the factor are identified Two approaches used to estimate the disease burden:

- Exposure based approach

- Assessment of the exposure of the study population to the risk factor is made
- Dose-response relationship for the given hazard is defined
- Exposure and dose-response are combined to produce estimates of outcome

- Outcome-based approach

- Disease outcome data are obtained
- The fraction attributable to the risk factor of interest is estimated

From: McEwens, Rec Sci tech Off. Int. Epiz., 31 (1)

Risk Assessment

- 1. Hazard identification
- 2. Hazard characterisation
- 3. Exposure assessment
- 4. Risk characterisation

The fundamental activities in exposure assessment:

- (a) clear depiction or drawing of the exposure pathway
- (b) detailing the necessary data requirements
- (c) summarising the data.

Adapted from: Codex Alimentarius, CAC/GL 77-2011

A. Buschulte, 27.08.2019, Latin American Risk Assessment Symposium, Montevideo, URY

Exposure Assessment

Antimicrobial resistant microorganism (AMRM) / Antimicrobial resistance determinant (AMRD)

Three major players

Selection of resistant bacteria in primary production/ pre-harvest Transmission of bacteria to meat during slaughter and processing

Risk Assessment

- 1. Hazard identification
- 2. Hazard characterisation
- 3. Exposure assessment
- 4. Risk characterisation

Handling and preparation of food in public or household environment

Sources of information: Antimicrobials sold in the EU 2015 (EMA 2017)

Sales of antimicrobial agents by antimicrobial class as percentage of the total sales for food-producing species, in mg/PCU, aggregated by 30 European countries, for 2015

But: where, when and for how long were these drugs used?

- Sales data reflect overall use but have limited analytical value
- Exposure of animals needs to measured on: species or production type level

> Number of treatments highly dependend on production level/stage

• Amount of substance alone is a poor measure.

Risk Characterization

Risk characterization considers the key findings from

- hazard identification,
- hazard characterization
- exposure assessment

to estimate the risk.

The **form** and the **outputs** will **vary** from assessment to assessment as a function of the risk management **request**!

Risk Assessment

- 1. Hazard identification
- 2. Hazard characterisation
- 3. Exposure assessment
- 4. Risk characterisation

International Journal of Food Microbiology Volume 159, Issue 1, 17 September 2012, Pages 30-38 ELSEVIER

Assessment of human exposure to 3rd generation cephalosporin resistant *E. coli* (CREC) through consumption of broiler meat in Belgium

Quantitative Risk from Fluoroquinolone-Resistant *Salmonella* and *Campylobacter* Due to Treatment of Dairy Heifers with Enrofloxacin for Bovine Respiratory Disease

H. Scott Hurd 🔄, Michael B. Vaughn, Derald Holtkamp, James Dickson, and Lorin Warnick

Qualitative risk assessment - example

Risk Assessment

- 1. Hazard identification
- 2. Hazard characterisation
- 3. Exposure assessment
- 4. **Risk characterisation**

Additional risk		Exposure assessment			
		Negligible	Moderate	High	
	Negligible				
Hazard	Mild				
characterisation	Moderate				
	Severe				

Quantitative risk assessment in AMR - challenges

- Bacterial concentrations are not constant over time
- Bacterial growth is determined by many factors
- Bacteria interact (horizontal gene transfer, competition) with varying intensity
- Resistance determinants can be carried by different bacterial species
- Knowledge of processes on presence and concentration of bacteria is still limited

More information can be found here: McEwen SA Quantitative human health risk assessments of antimicrobial use in animals and selection of resistance: a review of publicly available reports. Rev Sci Tech 2012 Apr;31(1):261-76

Summary

AMR risk assessment follows general risk assessment principles

Codex alimentarius guideline can and should be used

Major challenges

- Complexity of biology
 - Horizontal gene transfer within/between species
 - Cross and co-resistance
 - Bacterial growth
- AMR is related to human and veterinary medicine
 - Veterinary / food chain share needs to be determined
- Complex **exposure patterns**
 - Environment / Contact to animals / Contact to humans / Food
- **Shortage** on quantitative **data**

Bundesinstitut für Risikobewertung

Many thanks to my colleague PD Dr. Bernd-Alois Tenhagen

Thank you for your attention
