## Entering the world of genomics: the past 20 years

In early 2000s, the **Human Genome Project** produced a genome sequence that accounted for over 90% of the human genome

- International consortium of thousands of researchers
- **10 years** project

Today, it's a matter of **days** (**hours** to **weeks** depending on the specific NGS platform, sample preparation methods, and the desired coverage or depth of sequencing)

1. Context

**2. Epidemiological investigations and source attribution**

3. Risk assessemnt

4. Conclusion

# Outbreak investigation

## French examples

- Milk powder *Salmonella* ser. Agona (2018)
- Frozen pizzas *E. coli* STEC O26 (2022)
- Vegan cheese *L. monocytogenes* (2022)
- Chocolate *Salmonella* ser. Typhimurium (2022)

- ...

## Recent media coverage in Europe

- Frozen corn *L. monocytogenes* (2018)
- Eggs *Salmonella* ser. Enteritidis (2017-...)

- ...

## And in the world

- Romaine lettuce *E. coli* O26 - USA (multiannual)
- Polony sausage *L. monocytogenes* South-Africa (2018)
- Melon *L. monocytogenes* Australia (2018)

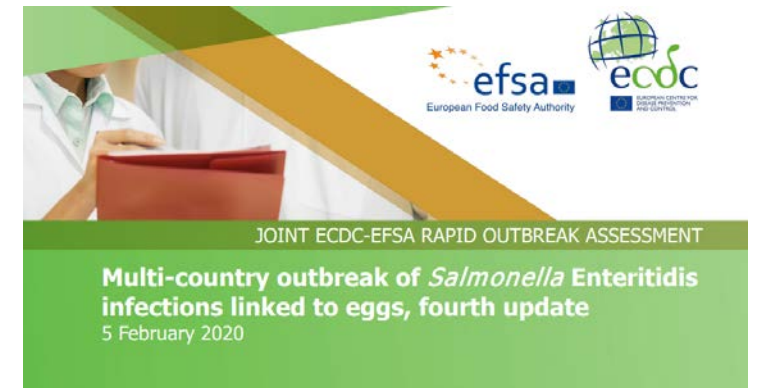

- ...

# Outbreak investigation

## A success for EU

- EFSA/ECDC Rapid outbreak assessment
- EURL role
- Database of WGS
- ...

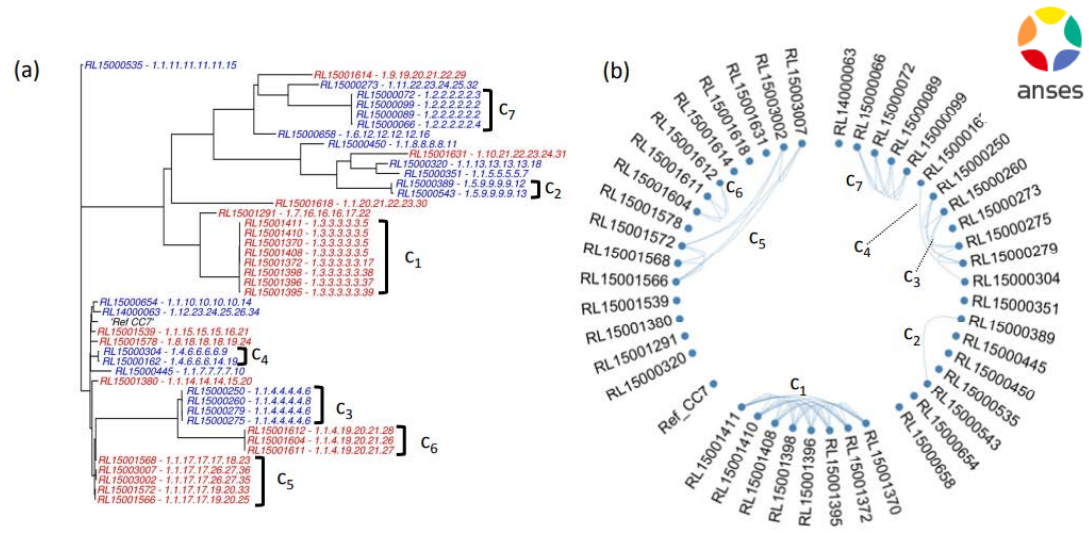

# Outbreak investigation

Principle is simple

- 1 Clustering of strains based on SNP/cgMLST distance
- 2 Use of epidemiological data (strains, patients,...)

Genomics alone is not sufficient to confirm an outbreak, epidemiologists still have to **investigate** to support **decision making**

# Outbreak investigation

A solution to solve every recorded cases ?

No

- Proportion of connected strains can be low (e.g. *Listeria*)
- Number of small genomic clusters is too important to be investigated in real life (e.g. *Salmonella* clusters in France)
- Somewhat a lack of well described food strains (metadata)
- Paths of contamination can be complex
- Strains can evolve rapidly (e.g. STEC)

# Beyond outbreaks

**Outbreaks** but also

... sporadic cases

(sporadic case = isolated case with no identified link to other cases of the same disease)

... unrecorded cases

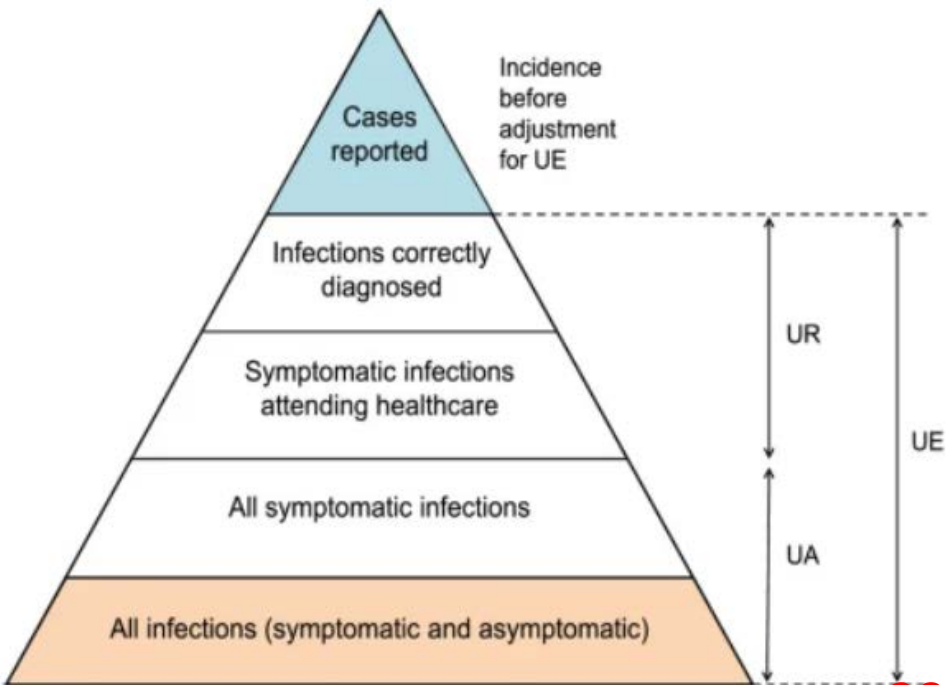

# Beyond outbreaks

## Estimated number of actual cases

« Pyramidal approach » (Van Cauteren et al., 2017)

Campylobacteriosis: N=4600

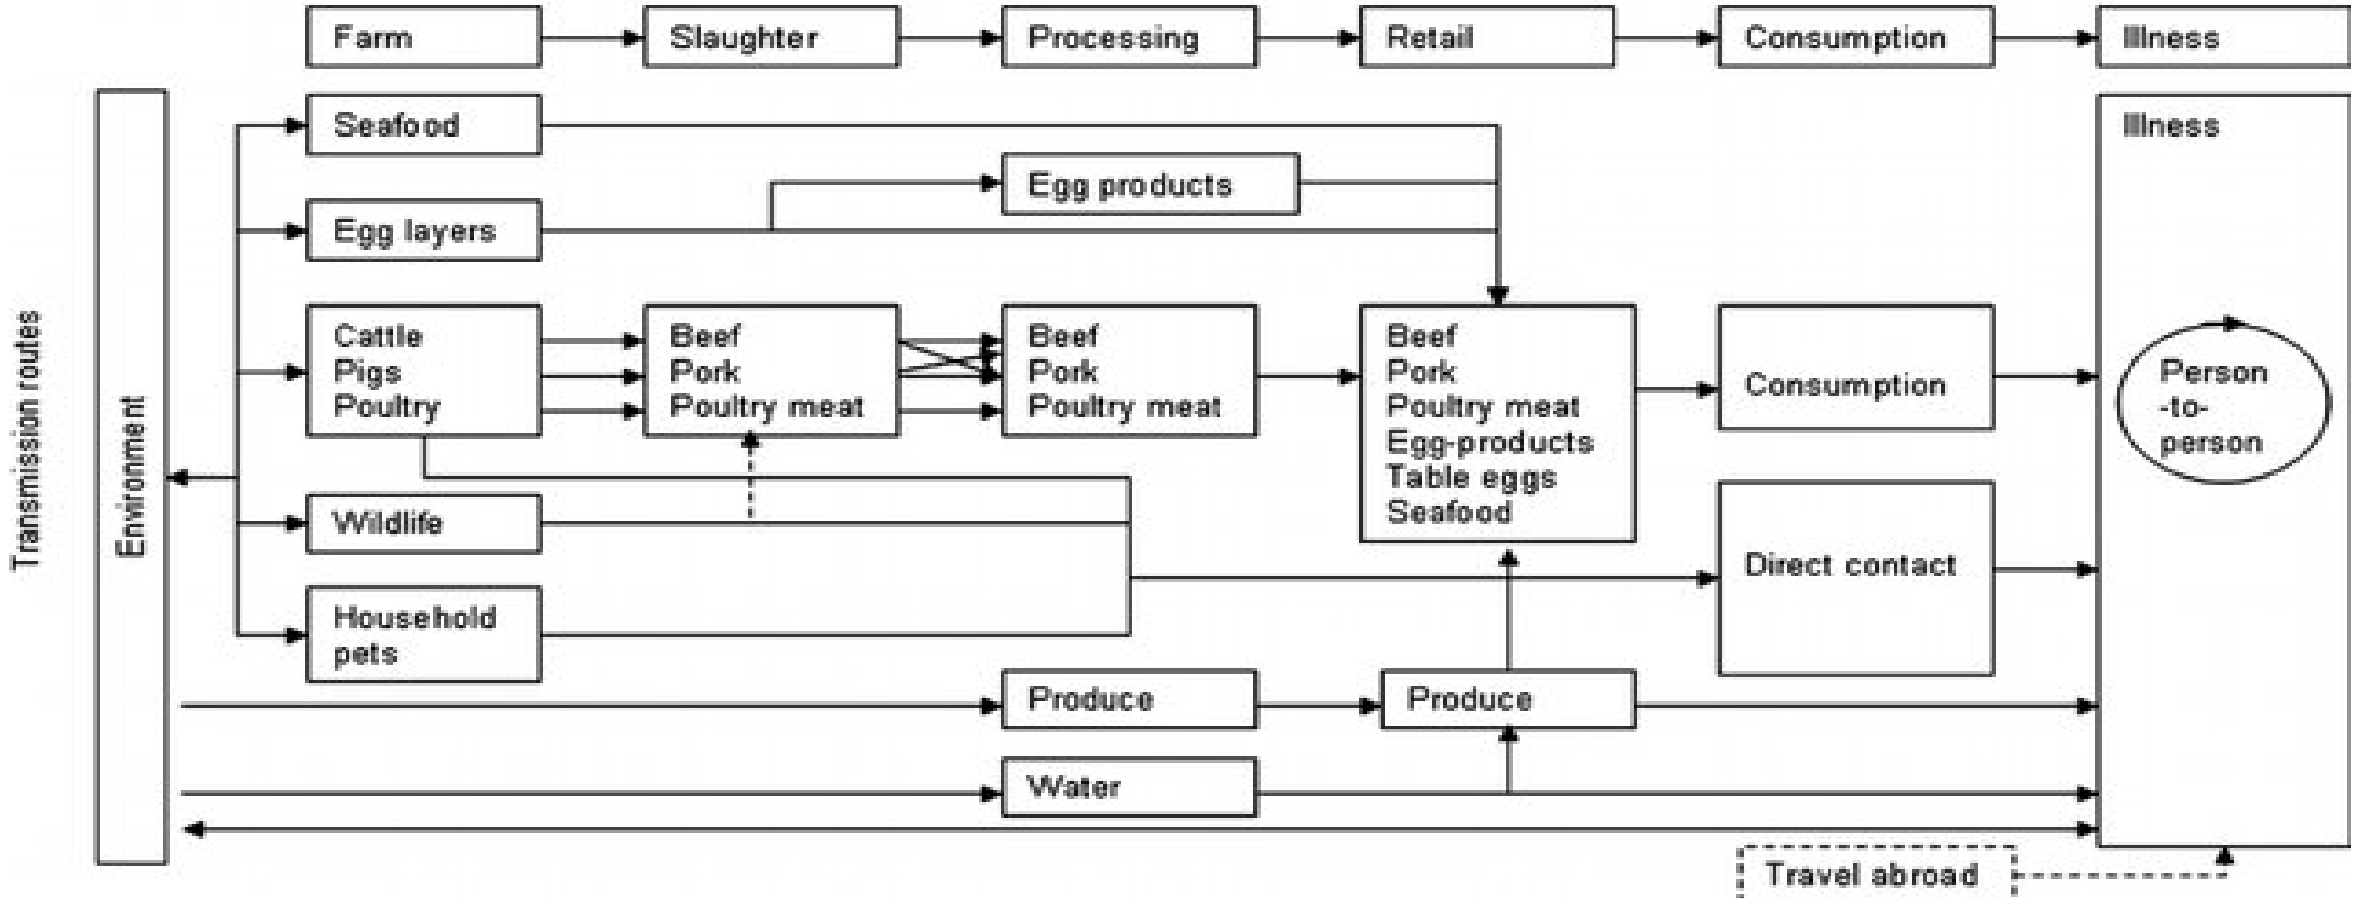

X 83

384 000 symptomatic  
IC90% [240 000 – 790 000]

# Source attribution

What is the main food (or other) origin of the cases?

# Source attribution methods

## Typing/genomic approaches

Origin	Strain	locus 1	locus 2	locus 3	locus 4	Membership coefficients to sources 1/2/3
 Source 1	Strain 1	28	31	32	7	1/0/0
	Strain 2	28	31	4	8	1/0/0
	Strain 3	28	12	32	7	1/0/0
	Strain 4	28	12	4	7	1/0/0
 Source 2	Strain 5	35	12	15	7	0/1/0
	Strain 6	35	42	15	7	0/1/0
	Strain 7	35	42	4	7	0/1/0
	Strain 8	35	42	15	8	0/1/0
 Source 3	Strain 9	7	15	22	7	0/0/1
	Strain 10	14	17	22	11	0/0/1
	Strain 11	7	17	22	7	0/0/1
	Strain 12	7	17	27	7	0/0/1
Strains to attribute 	Strain 13	35	42	4	8	0,07/0,92/0,01 
	Strain 14	28	31	32	8	0,97/0,02/0,01 
	Strain 15	7	15	32	7	0,22/0,04/0,74 
	Strain 16	14	17	2	11	0,04/0,04/0,92 

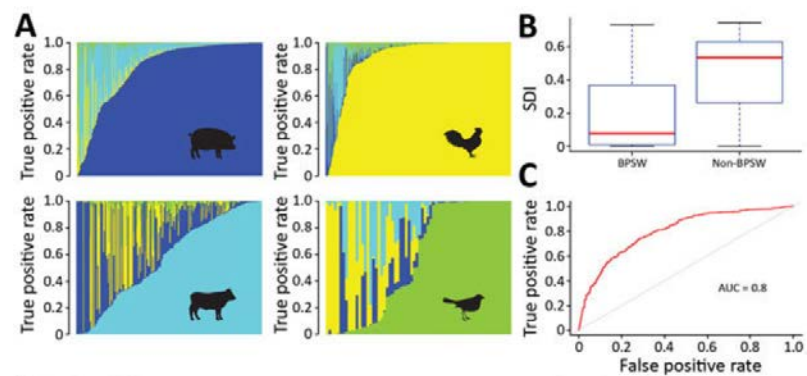

# Some source attribution results

## Typing/genomic approaches

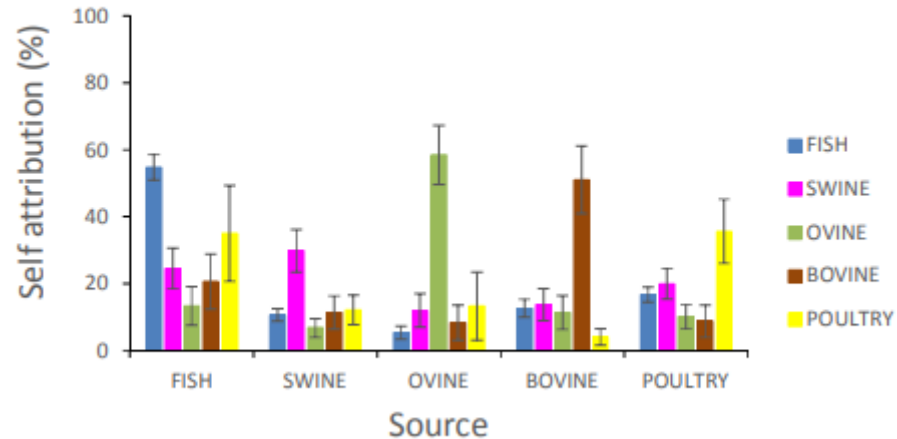

With WGS, the accuracy of the model is slightly improved

Need for complex model (accounting for possibility of transfert between source)

WGS is not (yet) a revolution for quantification of the importance of sources

STRUCTURE - self attribution

1. Context

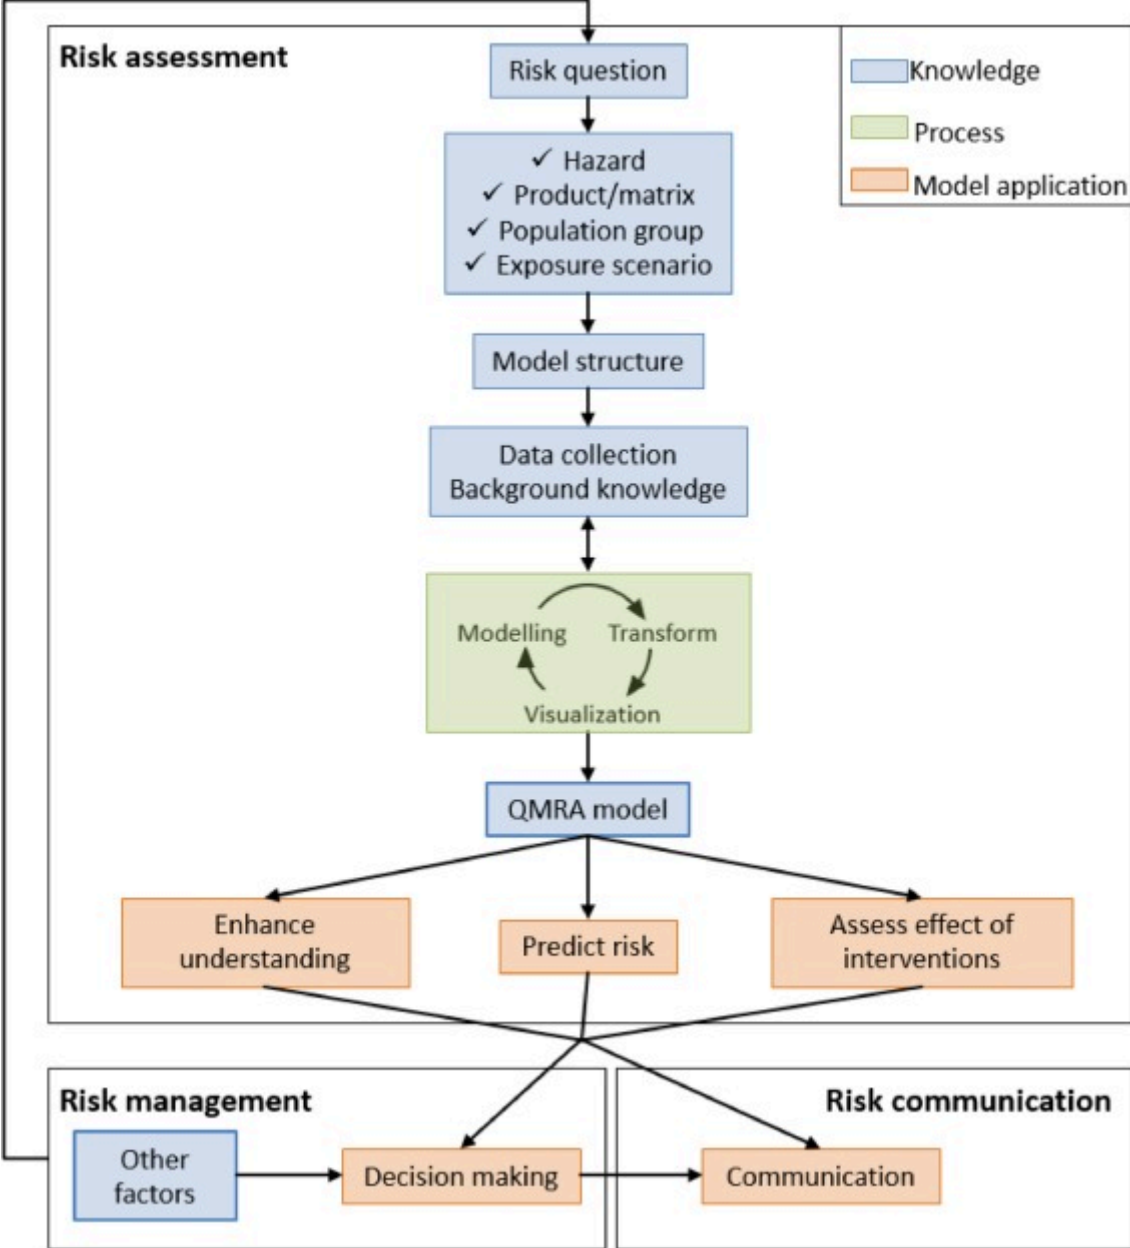

2. Epidemiological investigations and source attribution

**3. Risk assesemnt**

4. Conclusion

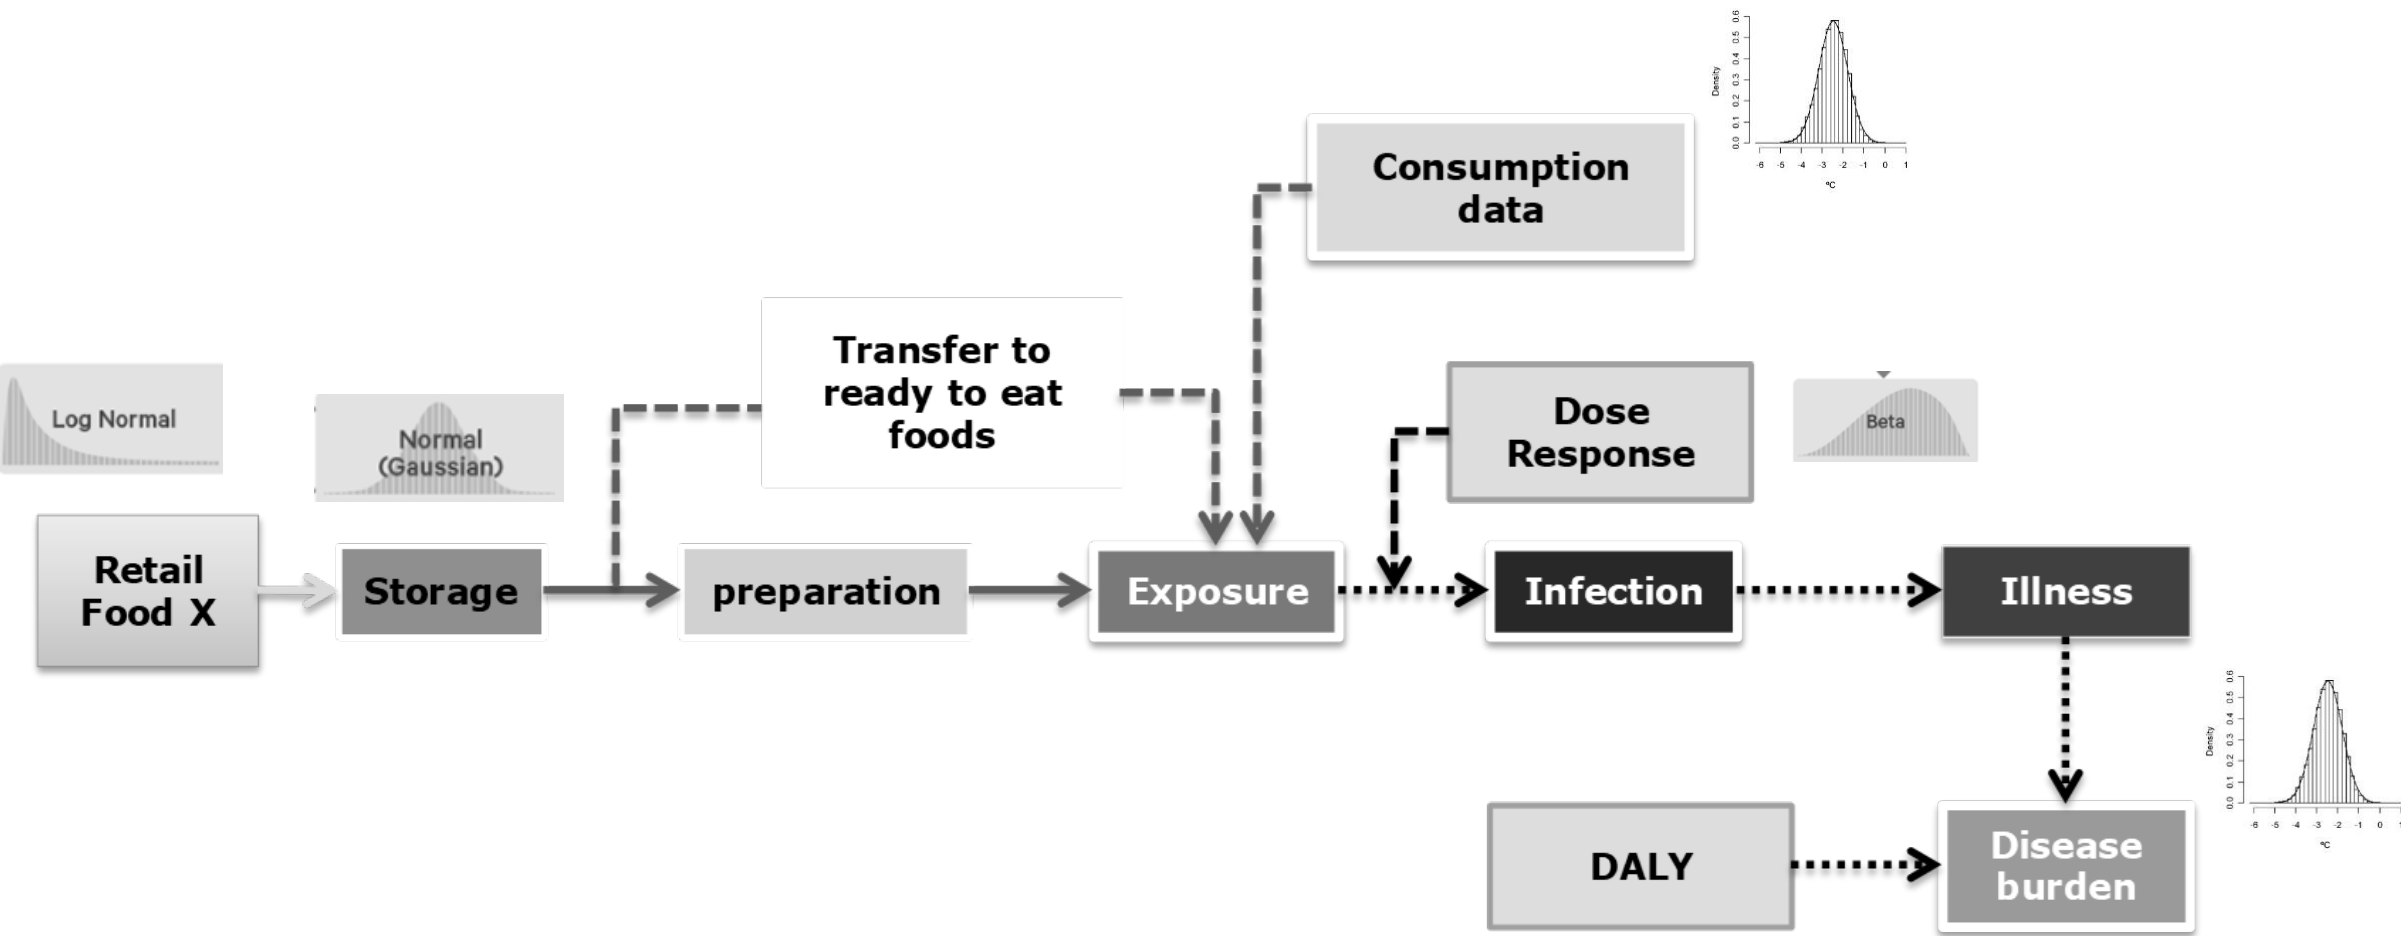

# Risk analysis

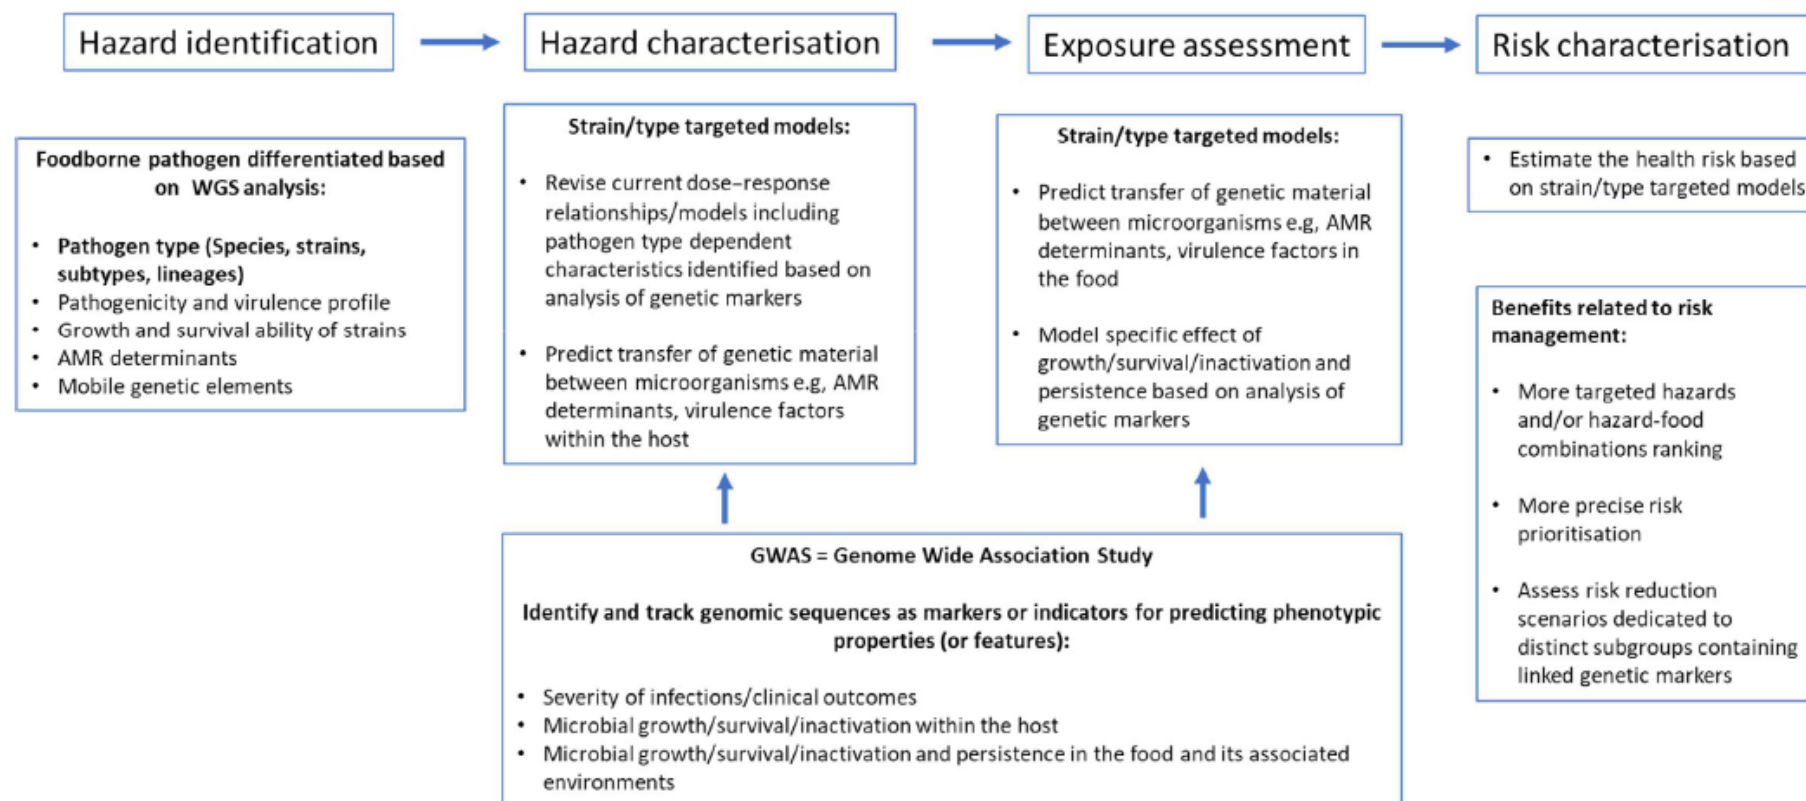

# Microbial risk assessment

## Whole genome sequencing and metagenomics for outbreak investigation, source attribution and risk assessment of food-borne microorganisms

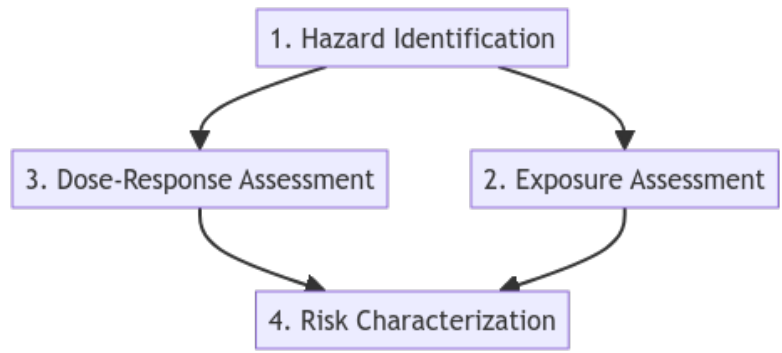

**Figure 2:** Future perspectives for WGS to add value to microbial risk assessment

# Dose-response: definition and use

## Part of QMRA

**Definition:** DR modeling uses mathematical relationships to describe the **probability** of adverse health effects due to exposure to a specific dose.

**Health effects :** infection, illness...

**Measurement of “dose”:** Dose levels are measured in number of microorganisms (could be oocysts, CFUs, PFUs, or number of genome copies)

# Dose-response: data and limits

## Large uncertainty

- Parameter uncertainty
- Data uncertainty: Are the (outbreak) data relevant to describe my population and strain variabilities?

## Strain variability

**How WGS can help to improve DR?**

# Tipping point for WGS in risk assessment

Is already there for dose response... driven by epidemiological data

## *L. monocytogenes*

Maury et al. 2016

Fritsch et al. 2018

To be published in 2024

# New *L. monocytogenes* dose response (Pouillot et al. 2024)

Article

## Updated Parameters for *Listeria monocytogenes* Dose–Response Model Considering Pathogen Virulence and Age and Sex of Consumer

Régis Pouillot <sup>1,\*</sup>, Andreas Kiermeier <sup>2</sup>, Laurent Guillier <sup>3</sup>, Vasco Cadavez <sup>4,5</sup> and Moez Sanaa <sup>6,\*</sup>

World Health  
Organization

### Step 1: Classify the strains according to : virulence

- **More virulent:** CC1, CC101, CC2, CC220, CC224, CC4, CC451, CC54, CC6, CC7, CC87)
- **Virulent:** CC14, CC155, CC177, CC18, CC20, CC21, CC26, CC3, CC37, CC379, C388, CC398, CC5, CC59, CC8, CC403 and all others
- **Less Virulent:** CC121, CC204, CC31, CC9, CC193, CC19, ST214

# New *L. monocytogenes* dose response (Pouillot et al. 2024)

## Step 2. Get the Proportion of each virulent group in food and human cases

RTE	More Virulent	Virulent	Less Virulent	Unknown	N
RTE Seafood	12%	35%	51%	1%	290
RTE Meats	20%	20%	59%	1%	176
RTE cheese and dairy	33%	47%	12%	8%	89
Human Sporadic Cases	60%	29%	8%	3%	262

Moller-Nielsen et al, 2017 Data for Seafood, Meat, cheese and sporadic cases

### EXTERNAL SCIENTIFIC REPORT

APPROVED: 13 December 2016

doi:10.2903/sp.efsa.2017.EN-1151

### Closing gaps for performing a risk assessment on *Listeria monocytogenes* in ready-to-eat (RTE) foods: activity 3, the comparison of isolates from different compartments along the food chain, and from humans using whole genome sequencing (WGS) analysis

Eva Møller Nielsen<sup>1</sup>, Jonas T. Björkman<sup>1</sup>, Kristoffer Kiil<sup>1</sup>, Kathie Grant<sup>2</sup>, Tim Dallman<sup>2</sup>, Anaïs Painset<sup>2</sup>, Corinne Amar<sup>2</sup>, Sophie Roussel<sup>3</sup>, Laurent Guillier<sup>3</sup>, Benjamin Félix<sup>3</sup>, Ovidiu Rotariu<sup>4</sup>, Francisco Perez-Reche<sup>4</sup>, Ken Forbes<sup>4</sup>, Norval Strachan<sup>4</sup>

### Abstract

# New *L. monocytogenes* dose response (Pouillot et al. 2024)

## Step 3. Get an exposure model

From EFSA:

- Exposure of the EU consumers to *L. monocytogenes* from Seafood, Meats and Cheese
- Empirical Distribution of the Contaminated servings of Lm per sub-populations

### SCIENTIFIC OPINION

ADOPTED: 6 December 2017

doi: 10.2903/j.efsa.2018.5134

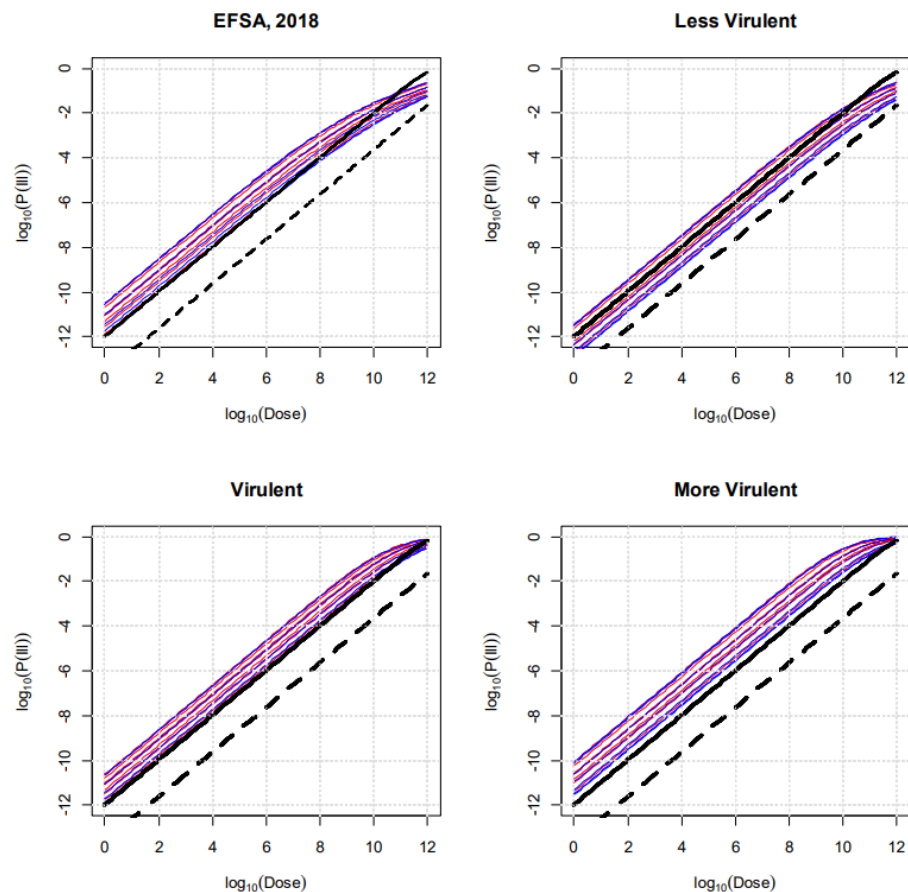

### ***Listeria monocytogenes* contamination of ready-to-eat foods and the risk for human health in the EU**

EFSA Panel on Biological Hazards (BIOHAZ),  
Antonia Ricci, Ana Allende, Declan Bolton, Marianne Chemaly, Robert Davies,  
Pablo Salvador Fernández Escámez, Rosina Girones, Lieve Herman,  
Konstantinos Koutsoumanis, Birgit Nørrung, Lucy Robertson, Giuseppe Ru, Moez Sanaa,  
Marion Simmons, Panagiotis Skandamis, Emma Snary, Niko Speybroeck, Benno Ter Kuile,  
John Threlfall, Helene Wahlström, Johanna Takkinen, Martin Wagner, Davide Arcella,  
Maria Teresa Da Silva Felicio, Marios Georgiadis, Winy Messens and Roland Lindqvist

### Abstract

# New *L. monocytogenes* dose response (Pouillot et al. 2024)

## Step 4. Infer DR parameters

README

## FoodsDR

This repository contains the R code and data necessary to derive the manuscript "Updated parameters for the dose-response model for *Listeria monocytogenes* considering pathogen virulence and age and sex of consumer". from Régis Pouillot, Andreas Kiermeier, Laurent Guillier, Vasco Cadavez, and Moez Sanaa. *Foods* 2024, 13(5), 751 (<https://doi.org/10.3390/foods13050751>), as well as the link to install the `doseresponsemodels` package.

## R package to use the Dose Response models

### Package installation

```
install.packages("devtools")
devtools::install_github("rpouillot/doseresponsemodels")
```

### Usage

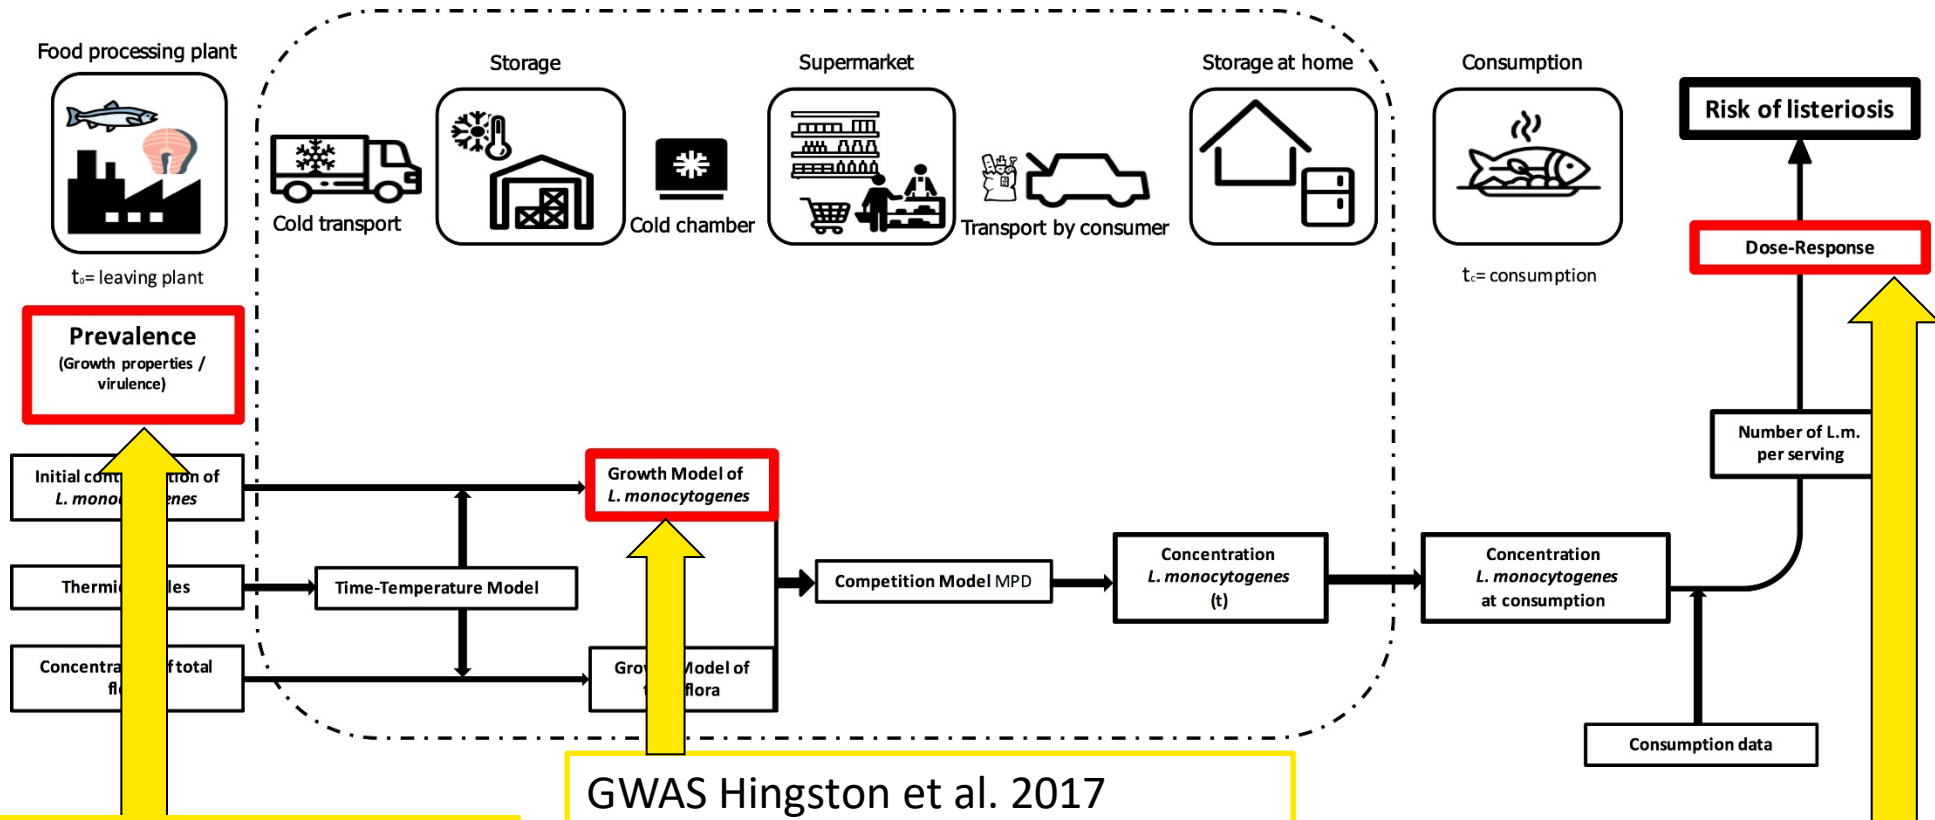

The `doseresponsemodels::DRQuick()` function provides a "quick" version of the function to derive the marginal probability of invasive listeriosis in a given population for a given dose in CFU (actual dose if the argument `Poisson = FALSE` or average dose if the argument `Poisson = TRUE`) using the "JEMRA" 2004, the "Pouillot" *et al.*, 2015, the "Fritsch" *et al.* 2018, the "EFSA", 2018 dose-response models or the model developed within this project ("EFSAMV" for more virulent strains, "EFSAV" for virulent strains, or "EFSALV" for the less virulent strains).

```
library("doseresponsemodels")
help('DRQuick')
DRQuick(1:10, model="JEMRA", population = 1:2)
DRQuick(1:10, model="Pouillot", population = 1:11)
DRQuick(1:10, model="EFSA", population = 1:14)
DRQuick(1:10, model="EFSAMV", population = 1:14)
```

# How to do in practical terms?

Fritsch et al. 2018, MRA

Implementation for cold smoked salmon-related listeriosis

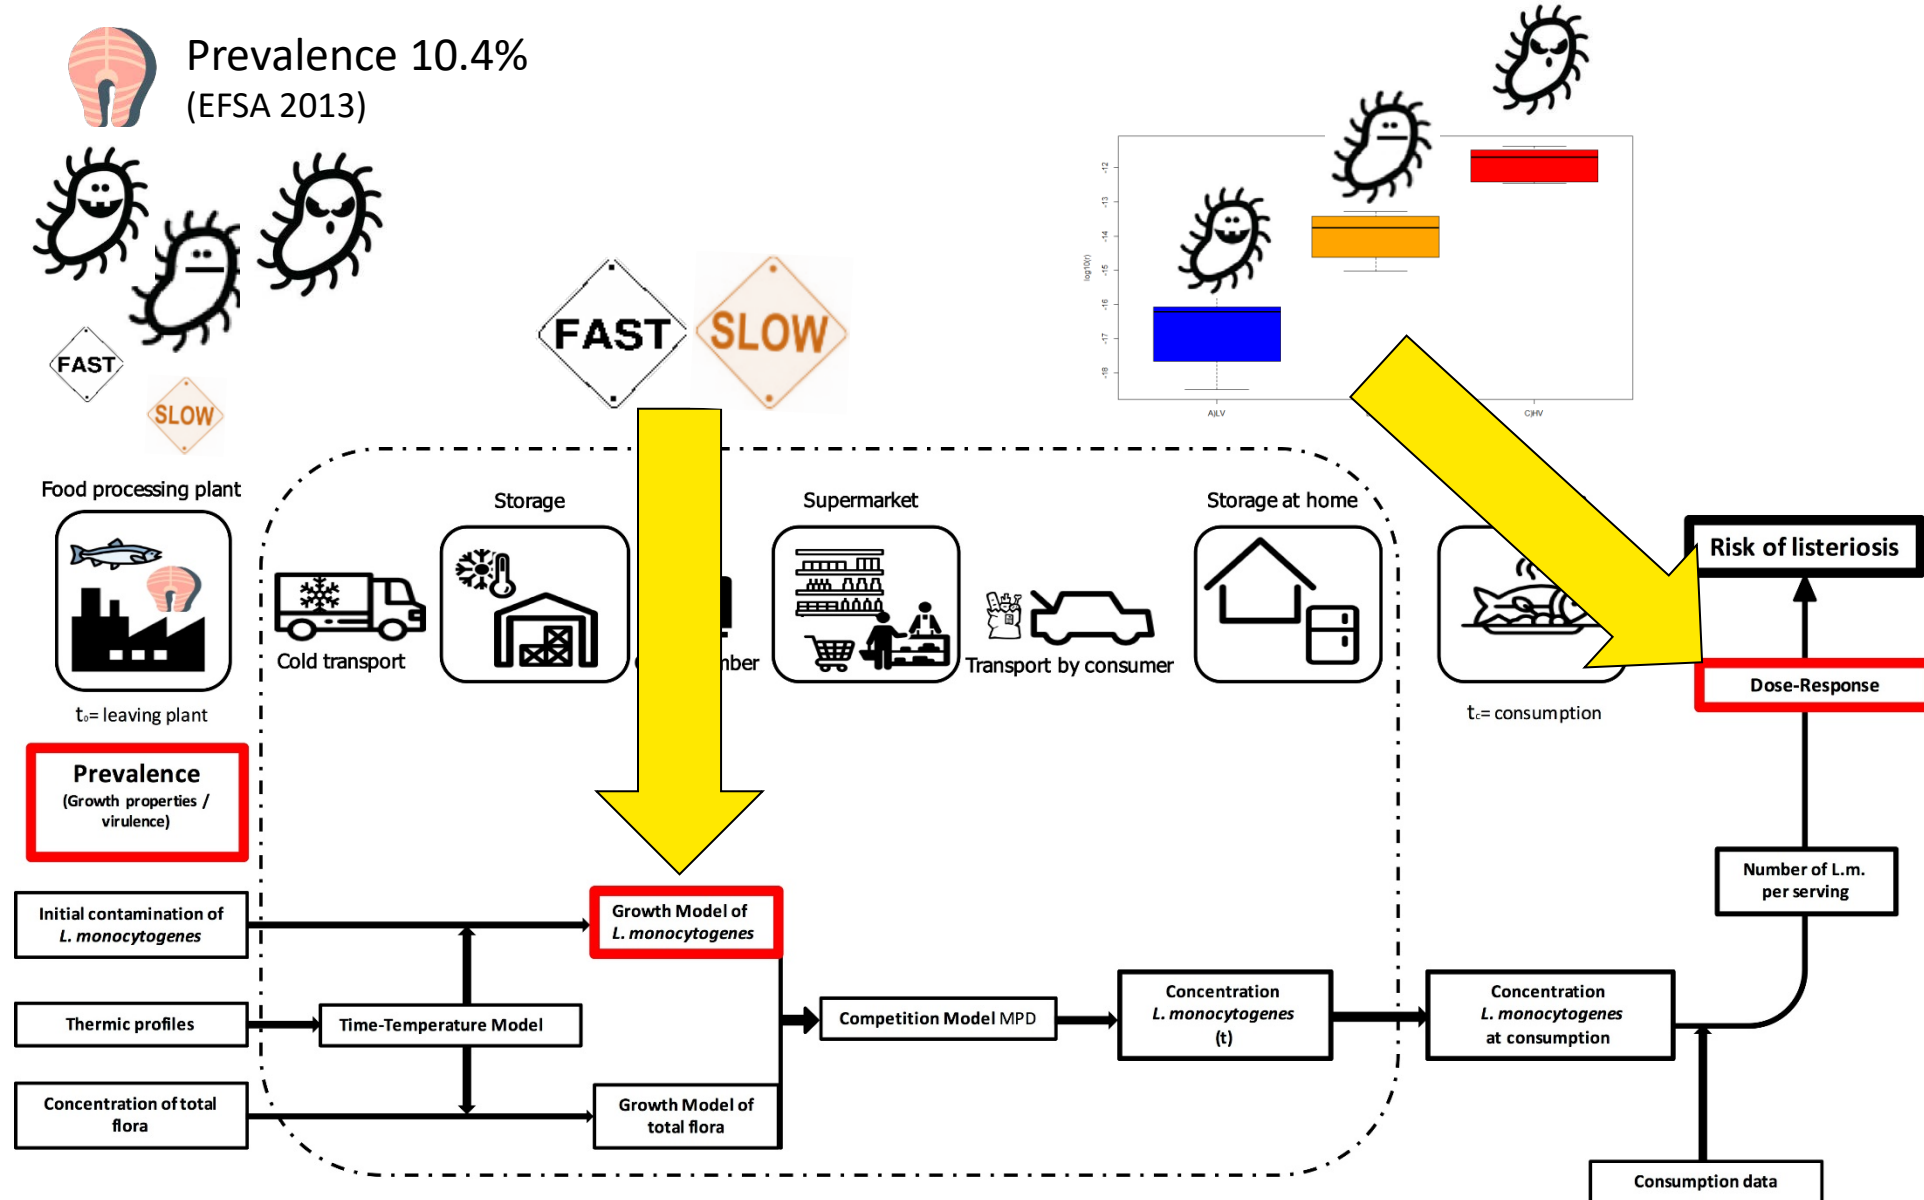

EFSA baseline +  
Møller-Nielsen et al. 2017  
294 sequenced strains

GWAS Hingston et al. 2017

Virulence  
Maury et al. 2016

# How to do in practical terms?

## Implementation for cold smoked salmon-related listeriosis

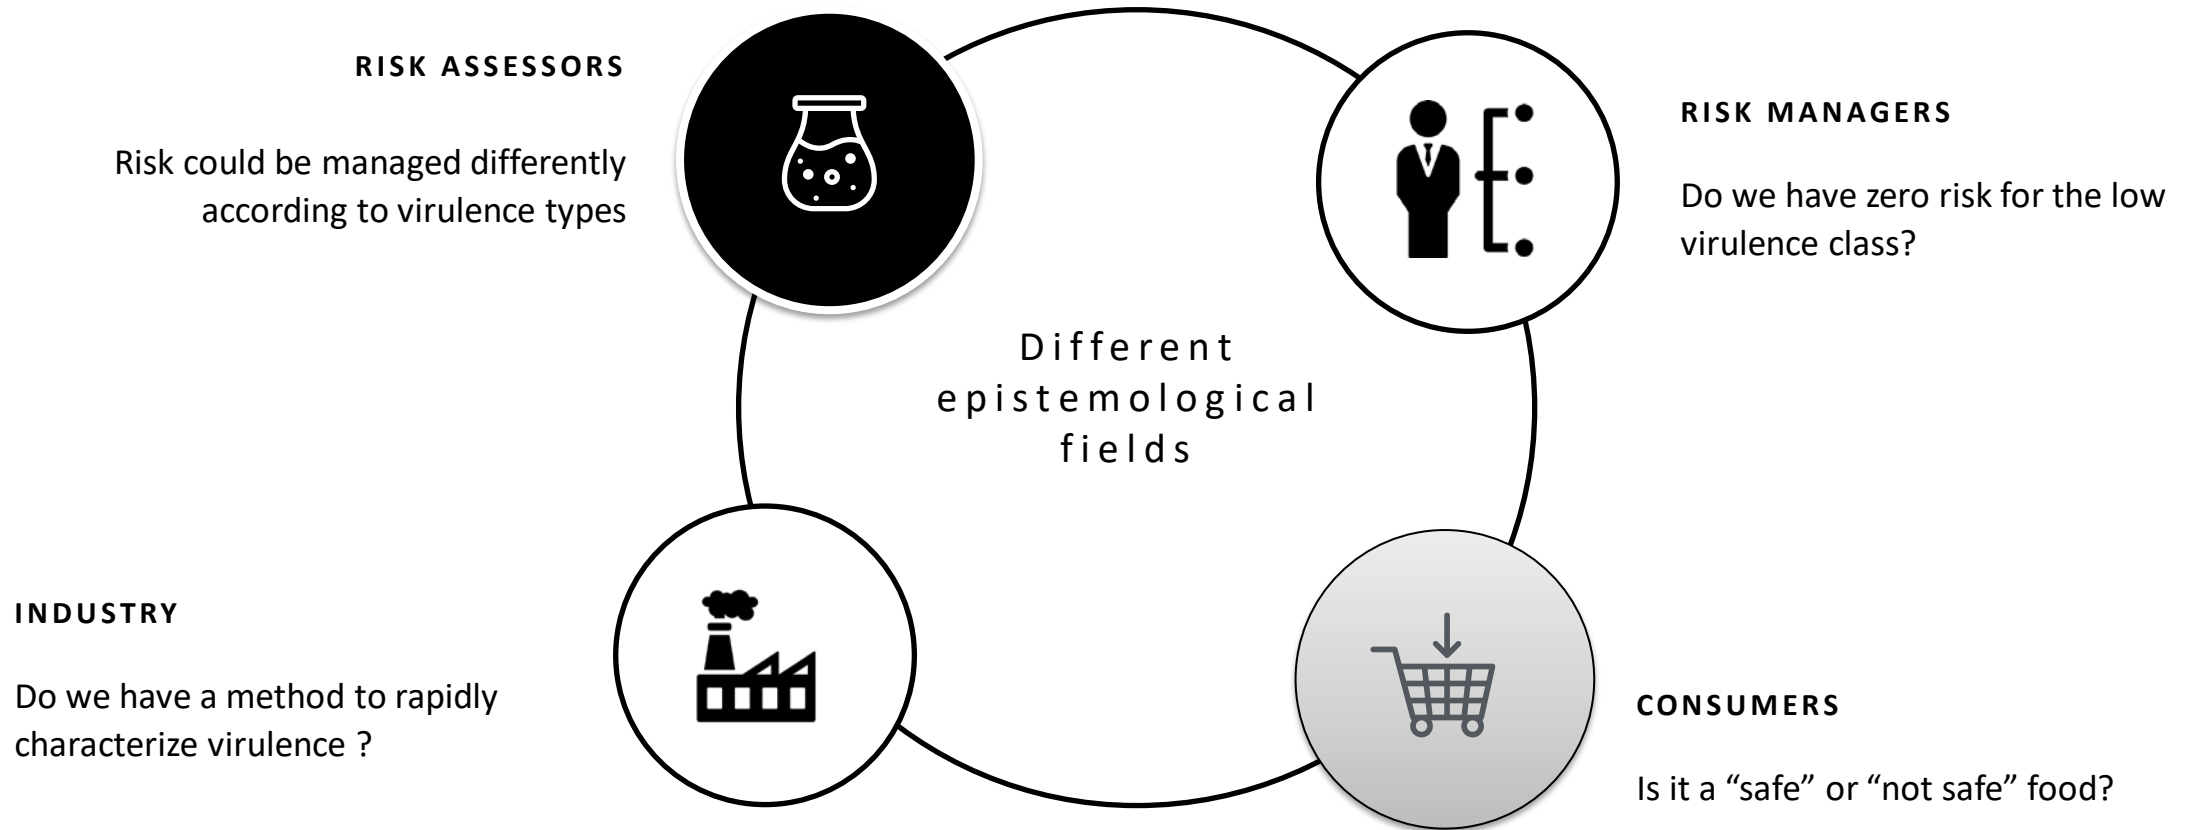

# How to do in practical terms?

Implementation for cold smoked salmon-related listeriosis

These results raise questions about the **management measures** associated with the different strains

# Are we ready to change ?

## 1. Context

## 2. Epidemiological investigations and source attribution

## 3. Risk assessment

## 4. Conclusion

# Conclusions: what has (will) WGS brought us?

## 1. Investigations of outbreaks

Real improvement

More to come with shared information at EU

Need to be aware that this will not solve everything

## 2. Source attribution

Not yet a revolution

## 3. Risk assessment

Methodologies are ready

Are people ready to change paradigm?

**Thank you for your attention**
